App.js

```
state = {
    name: John
}

eventHandler(){
    // change state
    this.setState({name: Mario})
}

<Child name={this.state.name}  onClick={ this.eventHandler(bind).this } />
```

event

props

You set the state and the functions in the main (higher) component.
In the child component you get props and you fire events that triggers
function in the main component

Child.js

```
clickEvent(){
    this.props.onClick
}
```
